

BESTSUPPORT Project Workflow Documentation

Scope: application logic only. Updated: June 1, 2026.

1. Purpose and Scope

This document explains the BESTSUPPORT application workflow from the business-logic side: request creation, approvals, assignments, ticket updates, incident reporting, notifications, document generation, and reporting. It is intended as a functional map for understanding how users move through the application and how the main modules work together.

2. High-Level Application Map

User Browser forms, pages, chat URL Routing accounts.urls tickets.urls Views and Forms validation

permission checks Models tickets, users, reports Templates HTML response Side Effects email

notifications documents Realtime chat, calls, alerts

3. Main Application Areas

Area	Main Components	App Responsibility
Accounts	accounts.models, accounts.forms, accounts.views	Users, authentication, branches, departments, support roles, Central Operation role, signatures, and session tracking.
Ticket intake	create_ticket, TicketForm, create_ticket.html	New Request chooser, General Support form, incident intake fields, assignment, notify email, CC email suggestions, attachments, priority calculation.
CBS access	CBSAccessRequestForm, CBS views, CBS templates	Head Office and Branch CBS requests, user groups, endorsement, digital sign-off, approved document generation, after-approval assignment, Central Operation report export.
Remote access	RemoteAccessApproval, remote access views	Remote access approval tickets with recommender/approver workflow and approval notifications.
Incident reports	IncidentReport, IncidentReportSignoff, incident	Formal incident report drafting, evidence, registered user signature, notified sign-off chain, correction, submit/send,

Area	Main Components	App Responsibility
	report views	and resolution gating.
Support queues	support dashboard and queue views	Filtered support worklists for department tickets, CBS requests, incidents, and general queue ownership.
Collaboration	<code>TicketMessage</code> , attachments, consumers	Ticket chat, message attachments, read state, audio call signaling, and browser notifications.
Documents	technical document views and document generators	Technical document visibility/downloads plus CBS and incident PDF/DOC generation.

4. Core Data Model Logic

Model	Purpose	Important Logic
<code>CustomUser</code>	Application user profile.	Holds department, branch, support role, Central Operation flag, phone, position, and uploaded signature used by CBS and incident sign-offs.
<code>Ticket</code>	Main work item.	Generates ticket code, calculates priority from impact/urgency, normalizes CC emails, tracks status, assignment, resolution, closure, and request type.
<code>RemoteAccessApproval</code>	Approval chain linked to a ticket.	Stores recommender, second recommender, approver, status, notes, acted-by users, signature snapshots, and CBS post-approval assignee.
<code>IncidentReport</code>	Formal incident report linked to an incident ticket.	Stores report fields, submit/correction state, registered user, notified user metadata, signatures, evidence summary, and final locking.
<code>IncidentReportSignoff</code>	Ordered incident sign-off rows.	Controls notified review/acknowledgement levels and prevents duplicate user/level combinations.
<code>TicketAssignmentLog</code>	Assignment history.	Records who assigned work, when ownership started, and when assignment ended for workload/reporting logic.
<code>TicketMessage</code> and <code>TicketMessageAttachment</code>	Ticket chat and files.	Stores conversation messages and uploaded chat files with access controlled by ticket membership rules.

5. New Request and Service Ticket Workflow

New Ticket New Request General Support standard form CBS Access dedicated form Incident / Remote

special form Validate Form department, branch, email Create Ticket ID, priority, files Notify email + in-

app

1. User opens **New Ticket** and sees the **New Request** chooser.
2. **General Support** keeps the user on the standard ticket form, defaulting to **Service Request**.
3. The form validates department, branch, assignment email, notify email, CC emails, impact, urgency, and attachments.
4. On submit, a **Ticket** is created with a generated ticket ID and calculated priority.
5. Assignment and notification emails are sent based on assign/notify/CC fields.
6. Assigned users, department users, requester, and support users see the ticket according to permission rules.

6. Ticket Status and Ownership Logic

Status	Meaning	Typical Actor
New	Ticket has been created and is waiting for support acknowledgement.	Requester / system
Acknowledged	Support has seen or accepted the request.	Support
In Progress	Work is actively being handled.	Assigned user / department
Waiting on User	Support needs more input from requester or affected user.	Support
Waiting on Third Party	Work depends on vendor or external team.	Support
Resolved	Support has completed work and entered a resolution.	Support / assignee
Closed	Ticket is fully closed.	Requester / support / close token
Cancelled / Duplicate	Ticket should not continue as a separate request.	Support

Assignment is tracked on the ticket and in assignment logs. Department-only tickets can be claimed by eligible department users. CBS tickets use the concerned CBS access provider label for the assignee once the request reaches the post-approval stage.

7. CBS Access Request Workflow

CBS Access Head Office / Branch CBS Form groups, signatures Recommender optional HO Second

Recommender Branch only Approver final decision Approved document generated Rejected edit &

resubmit Assign provider

1. User chooses **CBS Access**, then **Head Office** or **Branch**.
2. The CBS form records user information, access-user acknowledgement, type of user, old user ID, user groups, amendment reason, endorsement, after-approval assignee, CC users, and digital sign-off chain.
3. The system creates a CBS ticket and linked **RemoteAccessApproval** record with CBS-specific request

type.

4. The first pending reviewer receives an email and in-app notification.
5. For branch requests, the second recommender is used only when selected.
6. Final approver can approve or reject. Rejected requests can be corrected and resubmitted by the requester before finalization.
7. On approval, signature snapshots and request data generate the approved CBS document.
8. The ticket is assigned to the selected concerned CBS access provider and copied to after-approval CC users.
9. Central Operation can download the CBS Access Report CSV from the CBS Access Requests page.

8. Remote Access Approval Workflow

1. User opens the remote access request form from [New Request](#).
2. The form captures request details, recommender if selected, and final approver.
3. A ticket and [RemoteAccessApproval](#) chain are created.
4. Reviewer actions move the request from pending recommendation to pending approval or directly to final decision.
5. Approval or rejection is saved with actor, note, timestamp, notification, and visible ticket state.

9. Incident Ticket and Incident Report Workflow

Incident Ticket intake details Draft Report evidence + fields Registered Sign profile signature Notified

Signers ordered levels Submit send & lock Correction reopen levels

1. Incident ticket intake captures incident-specific data and identifies the owner/commander.
2. Incident report page creates or edits a structured [IncidentReport](#).
3. Evidence attachments are linked to the incident report and shown to permitted users.
4. Registered user signs the registered section from their uploaded profile signature.
5. Notified signers sign in configured order; earlier levels are reviewers and the final level is acknowledgement.
6. If a signer requests correction, later signatures are cleared and the report becomes editable again.
7. When all required signatures are complete, submit sends the report, locks editing, and marks the linked ticket resolved.

10. Permissions and Visibility

Role / Participant	Visibility and Actions
Requester	Can view own tickets, chat when permitted, edit/resubmit rejected CBS requests, and receive resolution/closure notifications.
Assigned user	Can manage work assigned to them, update status, resolve tickets, and participate in chat.
Department member	Can see department queue tickets for matching department/branch and claim eligible

Role / Participant	Visibility and Actions
	work.
IT support / staff / superuser	Can access support queues, update tickets, manage assignments, and access broader ticket operations.
Central Operation	Can access CBS Access Requests, adjust allowed CBS chain/provider details, participate in CBS visibility, and download CBS Access Report CSV.
CBS sign-off users	Can access assigned CBS approval steps and retain historical access when they have acted.
Incident signers	Can view/sign assigned incident report sign-off levels and request correction when needed.

11. Notifications, Email, and Documents

- New ticket email goes to notify email or default support mailbox, with CC emails when provided.
- Assignment email goes to a specific assigned user when set.
- CBS approval flow emails the next reviewer, then requester, then concerned CBS access provider after final approval.
- After-approval CBS CC users are copied on the approved assignment email and appear as normal comma-separated addresses in the generated document.
- Incident report submit sends the signed report to configured recipients and CC recipients.
- Documents can be generated for CBS access requests and incident reports as PDF/DOC where the workflow allows.

12. Chat, Attachments, and Realtime Logic

- Ticket chat access is calculated from requester, assignee, department membership, support roles, CBS approval participants, incident participants, and historical signers where applicable.
- Chat can be locked by ticket state or privacy rules.
- Message attachments are stored as ticket-linked attachment records and exposed only to users with ticket access.
- Realtime consumers broadcast chat updates, notification changes, read state, and audio-call signaling to eligible users.

13. Reporting and Queues

View	Purpose	Filters / Output
Support Dashboard	Summary of support workload and shortcuts.	Links to queue, department, CBS, incidents.
Support Queue	General support worklist.	Ticket ID, department, branch, assignee, status, priority, date filters.

View	Purpose	Filters / Output
CBS Access Requests	CBS-specific queue for support and Central Operation.	Same support filters plus CBS-specific ticket metadata and report download.
CBS Access Report CSV	Later record of who received which CBS access.	Ticket ID, status, dates, access user, employee ID, old CBS ID, user groups, requested/approved/concerned users, resolution.
Incident Tickets	Incident-specific queue.	Incident ticket status and linked incident report actions.
Technical Documents	Document library visible by branch/department/role rules.	View/download allowed documents.

14. Primary URL Logic

Route	View	Business Use
/tickets/	ticket_list	User-facing ticket list and request tracking.
/tickets/new/	create_ticket	New Request chooser and standard ticket/incident intake.
/tickets/cbs-access-request/	cbs_access_request	Head Office CBS access request.
/tickets/cbs-access-request/branch/	cbs_access_branch_request	Branch CBS access request.
/tickets/remote-access-request/	remote_access_request	Remote access approval request.
/tickets/<id>/	ticket_detail	Ticket detail, approvals, chat, files, CBS/incident sections.
/tickets/<id>/remote-access-approval/	remote_access_approval_update	Approval/rejection actions for remote/CBS approval chains.
/tickets/<id>/incident-report/	ticket_incident_report	Create, edit, view, sign, and submit incident report.
/tickets/support/cbs-access/	support_cbs_access_requests	CBS queue for support and Central Operation.
/tickets/support/cbs-access/report.csv	support_cbs_access_report_export	CBS access CSV report export.
/tickets/support/<id>/update/	ticket_update	Support status, assignment, and resolution update.

15. App Logic Change Checklist

- For ticket form changes, update TicketForm, create_ticket.html, creation view validation, notification rules, and user guide.

- For CBS workflow changes, update CBS form fields, description parsing/building, approval update logic, document generation, Central Operation actions, tests, and report export if fields change.
- For incident report changes, update report model/form, sign-off formset, submit validation, download generation, correction behavior, and resolution blockers.
- For permission changes, update visibility helpers, queue filters, chat access helpers, templates, and tests.
- For email or notification changes, update the triggering view/helper, recipient logic, message body, and related tests.
